

# IBM Resilient

## Incident Response Platform Integrations

### Jira Function V1.0.0

Release Date: April 2018

Resilient Functions simplify development of the integrations by sending data from the Resilient platform to a remote program that performs an activity then returns the results to the function. The results can be acted upon by a script and the result of that becomes a decision point in the Resilient workflow.

This guide describes the Jira Function.

## Overview

The Jira integration with the Resilient platform allows for the tracking of Incidents as Jira Issues. Bidirectional links are saved to allow for easy navigation between the applications.

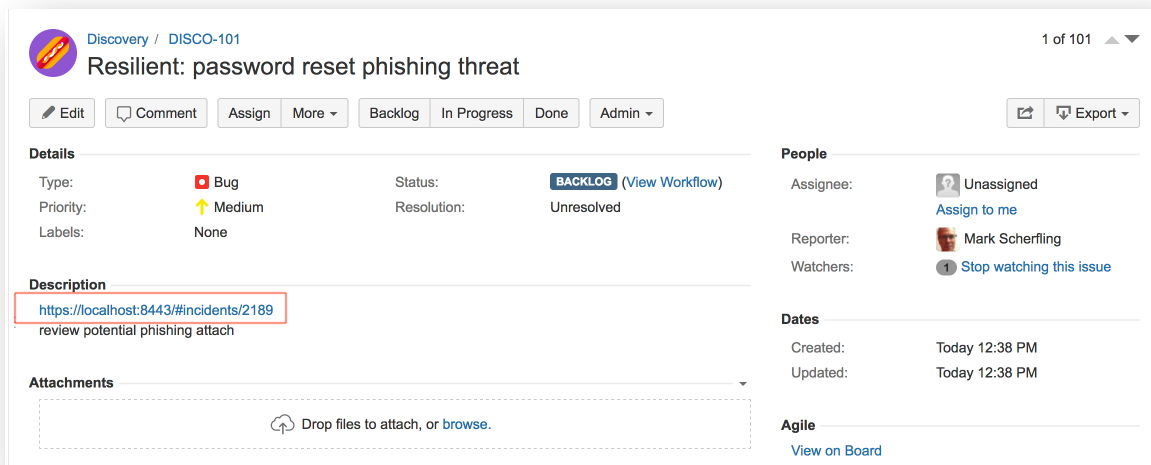

This integration allows for the creation of Jira issues, adding comments, and transitioning issues when the corresponding Incident is closed. The following screenshots show how this would appear in an incident.

The screenshot shows the IBM Resilient incident interface for an incident titled "password reset phishing threat". The interface is divided into several sections: Summary, Description, Tasks, and People. The Summary section on the left lists details such as ID 2189, Phase Engage, Severity Low, Date Created 04/07/2018, Date Occurred —, Date Discov... 04/07/2018, Data Compr... Unknown, and Incident Type Phishing. A red box highlights the "Jira Ticket ..." link. The Description section on the right shows "review potential phishing attach". Below the Description is a "Tasks" section with a progress bar at 0% Complete and a table of tasks. The table has columns for Task Name, Owner, Due Date, Flags, and Actions. The tasks listed are "Initial Triage", "Interview key individuals", "Notify internal management chain (preliminary)", and "Determine if illegal activity is involved". The People section at the bottom shows "Created By Resilient Sysadmin", "Owner Resilient Sysadmin", and "Members There are no members."

## Setup

The following lists the system requirements:

- Python version 2.7.10 or later, or version 3.6 or later
- Resilient Circuits and Resilient Python libraries version 30.0 or later
- Resilient platform version 30.0 or later
- Jira version 7.4 or later

Perform the following to install and configure the function:

1. Ensure the environment is up to date:

```
sudo pip install --upgrade pip
sudo pip install --upgrade setuptools
sudo pip install --upgrade resilient-circuits
```

2. Install the required software for the function (if not already installed):

```
sudo pip install fn_jira-<version>.tar.gz
```

3. Add the function to the Resilient platform:

```
resilient-circuits customize
```

You are prompted to answer prompts to import functions, message destinations, etc.

4. From the account used for Integrations, use one of the following commands to configure the Jira settings. Use `-c` for new environments or `-u` for existing environments.

```
resilient-circuits config -c
```

OR

```
resilient-circuits config -u
```

5. Edit the `.resilient/app.config` file and section `[jira]`:

```
url=<jira url>
user=<jira access user>
password=<jira access password>
verifyFlag=[True|False]
```

Use False for self-signed SSL certificates.

After completing the configuration steps, enter the `resilient-circuits run` command. The following is an example of the resulting messages indicating the successful connection to the Resilient platform and the loading of the Jira integration modules.

```
$ resilient-circuits run
2018-04-07 12:38:04,164 INFO [app] Configuration file:

## Resilient Platform Configuration

In the Customization Settings section of the Resilient platform, you can verify that the following Jira specific functions, workflows and rules are available in the Resilient platform by clicking their respective tabs.

- **Functions**
  - **Jira Create Issue.** Creates a Jira issue including an incident's title, description and severity level. A custom Incident field provides a link back to Jira. See the corresponding workflow which defines which issue project and issue type to use.
  - **Jira Create Comment.** Creates a Jira comment based on adding a note to an incident. The note's description field is referenced.
  - **Jira Transition Issue.** Transitions a Jira issue. See the corresponding workflow which defines the transition ID to use.

- Workflows. Some modifications are needed for your Jira environment as indicated below.
  - **Jira Open Issue.** Edit the Jira Open Issue function for the specific **jira\_project** and **jira\_issuetype** fields for your Jira use.
  - **Jira Create Comment.**
  - **Jira Transition Issue.** Edit the Jira Transition Issue function for the specific **jira\_transition\_id** required in your workflow. The default value of 41 represent the Jira close issue state.
- Rules. Operate on an incident or an incident's notes. If you wish to change rules from automatic to menu item, new rules referencing the same workflows need to be created.
  - Jira Open Issue
  - Jira Create Comment
  - Jira Close Issue

## Layout

To display a link back to the Jira issue created from an incident,

- Navigate to the Customization Settings and select the Summary Section from the Layouts tab
- Search for the Jira custom fields and drag Jira Ticket URL to the Summary Section
- Click Save

Customization Settings

The screenshot displays the 'Customization Settings' interface. At the top, there is a navigation bar with tabs: Layouts, Rules, Scripts, Workflows, Functions, Message Destinations, Phases & Tasks, Incident Types, Breach, and Artifacts. The 'Layouts' tab is selected. On the left, a sidebar lists various sections: New Incident Wizard, Incident Tabs, Manage Tabs, Summary Section (highlighted with a red box and a checkmark), Tasks, Details, Breach, Notes, Members, News Feed, Attachments, and Stats. The main area is titled 'Incident: Summary Section' and contains a list of fields: Summary, ID, Phase, Severity, Date Created, Date Occurred, Date Discovered, Data Compromised, Incident Type, and Jira Ticket URL (highlighted with a red box). A red arrow points from the 'Jira Ticket URL' field in the list to the 'Jira Ticket URL' field in the 'Fields' section on the right. The 'Fields' section also contains 'Jira Internal URL' and 'Jira Ticket URL' (both highlighted with red boxes). Below the fields, there are sections for 'Views' (Attachments Widget, News Feed Widget, Related Incidents Widget) and 'Blocks' (Header).

## Operation

The default operation is to automatically create a Jira issue when a Resilient incident is created. You can change this behavior as indicated in the Configuration section above. Furthermore, you can add conditions to restrict the type of Incidents which trigger Jira issue creation.

## Troubleshooting

There are several ways to verify the successful operation of a function.

- Resilient Action Status

When viewing an incident, use the Actions menu to view Action Status. By default, pending and errors are displayed. Modify the filter for actions to also show Completed actions. Clicking on an action displays additional information on the progress made or what error occurred.

- Resilient Scripting Log

A separate log file is available to review scripting errors. This is useful when issues occur in the pre-processing or post-processing scripts. The default location for this log file is:

```
/var/log/resilient-scripting/resilient-scripting.log
```

- Resilient Logs

By default, Resilient logs are retained at `/usr/share/co3/logs`. The `client.log` may contain additional information regarding the execution of functions.

- Resilient-Circuits

The log is controlled in the `.resilient/app.config` file under the section `[resilient]` and the property `logdir`. The default file name is `app.log`. Each function creates progress information. Failures show up as errors and may contain Python trace statements.

## Support

For additional support, contact [support@resilientsystems.com](mailto:support@resilientsystems.com).

Including relevant information from the log files will help us resolve your issue.
