Release Notes

v1.0.2

- Support added for App Host.

v1.0.1

- Support added for App Host.

v1.0.0

- Initial Release
-

Overview

Resilient Circuits Components for McAfee TIE Functions

The McAfee TIE Functions for IBM Resilient provides the ability to search McAfee Threat Intelligence Exchange (TIE) server for information on a specific file hash. This information can come from any of the providers:

- Enterprise
- GTI
- ATD
- MWG

In addition, a system list is returned by the function.

Installation

Requirements

- Resilient platform **>= v35.0.0**
 - To setup up an App Host see: ibm.biz/res-app-host-setup
- An Integration Server running **resilient_circuits>=30.0.0** (if using an Integration Server)

- To set up an Integration Server see: ibm.biz/res-int-server-guide
- If using an API key account, minimum required permissions are:

Name	Permissions
Org Data	Read
Function	Read

Install

- To install or uninstall an App using the App Host see ibm.biz/res-install-app
- To install or uninstall an Integration using the Integration Server see the ibm.biz/res-install-int

App Configuration

The following table describes the settings you need to configure in the app.config file. If using App Host, see the Resilient System Administrator Guide. If using the integration server, see the Integration Server Guide.

Config	Required	Example	Description
dxlclient_config	Yes	<code>/home/integration/.resilient/mcafee_tie/dxlclient.config</code>	Path to the <i>dxlclient.config</i> file

In addition to updating the app.config file and before running the McAfee TIE functions, you need to generate the dxlclient.config, certificates and key files using an OpenDXL client provisioning command. More information on the dxlclient.config file and provisioning the system can be found here:

<https://opendxl.github.io/opendxl-client-python/pydoc/provisioningoverview.html> <https://opendxl.github.io/opendxl-client-python/pydoc/basiccli provisioning.html#basiccli provisioning>

Here is an example of the OpenDXL client provisioning command:

```
python -m dxlclient -vv provisionconfig /home/integration/.resilient/fn_mcafee_tie X.X.X.X  
client1 -u admin -p password
```

In this example, `X.X.X.X` is the IP address of the McAfee ePO server or OpenDXL Broker.

The generated files are created in the `/home/integration/.resilient/fn_mcafee_tie` directory.

If installing the app on an integration server, set the `dxlclient_config` app.config parameter to the location of the created `dxlclient.config` file.

```
[fn_mcafee_tie]  
dxlclient_config=/home/integration/.resilient/fn_mcafee_tie
```

If installing the app directly to the Resilient platform (App Host environment), you need to use the New File button to create each file that was created by the provisioning command. As you create each file, copy the contents of the file into your new file. Make sure to enter `/etc/rescircuits/fn_mcafee_tie` as the File Path. See the Resilient Platform System Administrator Guide for the detailed procedure.

Custom Layouts

- Customize the Artifacts Tab page by dragging the TIE Results data table on to it as pictured below or create your own McAfee TIE incident tab and drag the TIE Results on to it:

McAfee SHA-256 Hash

Function - McAfee TIE search hash

A function which takes two inputs:

mcafee_tie_hash_type: The type of file hash (md5, sha1, sha256). mcafee_tie_hash: The value of the hash.

The function returns a JSON object containing the available information from the different file providers (Enterprise, GTI, ATD, MWG) along with the list of systems related to it.

Name

McAfee TIE search hash

API Name

mcafee_tie_search_hash

Message Destination

McAfee TIE MD

Description

A function which takes two inputs:

mcafee_tie_hash_type: The type of file hash (md5, sha1, sha256).
mcafee_tie_hash: The value of the hash.

The function returns back a dict of all the available information from the different file providers (Enterprise, GTI, ATD, MWG) along with the list of systems related to it.

Input: Hash artifact

McAfee TIE search hash

Output: Row entry in the TIE Results data table

► Example Pre-Process Script:

```
if artifact.type == "Malware MD5 Hash":
    inputs.mcafee_tie_hash_type = "md5"
    inputs.mcafee_tie_hash = artifact.value
elif artifact.type == "Malware SHA-1 Hash":
    inputs.mcafee_tie_hash_type = "sha1"
    inputs.mcafee_tie_hash = artifact.value
elif artifact.type == "Malware SHA-256 Hash":
    inputs.mcafee_tie_hash_type = "sha256"
    inputs.mcafee_tie_hash = artifact.value
else:
    helper.fail("Artifact hash was not set correctly")
```

► Example Post-Process Script:

```
"""
Data returned will be in the following structure

{
  "GTI":{
    "File Provider":"GTI",
    "Attributes":{

    },
    "Create Date":"2018-02-21 12:17:10",

Troubleshooting & Support

If using the app with an App Host, see the Resilient System Administrator Guide and the App Host Deployment Guide for troubleshooting procedures. You can find these guides on the [IBM Knowledge Center](#), where you can select which version of the Resilient platform you are using.

If using the app with an integration server, see the [Integration Server Guide](#)

For Support

This is an IBM Supported app. Please search <https://ibm.com/mysupport> for assistance.
