## Release Notes

Version	Date	Notes
1.0.0	10/2021	Initial Release
1.0.1	3/2022	Bug fix for defender_update_incident
1.0.2	7/2022	Bug fix for defender_get_related_alert_information
1.1.0	9/2022	Added filtering at the alert level

### V1.1 Considerations

See section [App Configuration](#) for the new app.config setting: `alert_filters`. This setting must be manually added to your app.config file in order to use it with the poller to filter incident creation.

## Overview

Resilient Circuits Components for 'fn\_microsoft\_defender'

Functions

defend

Name	Description
Defender Alert Search	Return Defender alerts based on a set of search criteria
Defender App Execution	Perform app restriction actions on a Microsoft Defender machine
Defender Collect Machine Investigation Package	Collect the machine investigation package
Defender Delete Indicator	Delete an indicator from Defender ATP
Defender Find Machines by File	Find machines which match a given file hash
Defender Find machines by filter	Find machines based on the OData filter capability of Defender
Defender Find Machines by Internal IP	Find Defender Machine(s) by internal IP address
Defender Get File Information	Get additional information about a Defender SHA1 or SHA256 file reference.
Defender Get Incident	Get a Defender 365 Incident
Defender Get Related Alert Information	Get a Defender ATP machine alert details
Defender List Indicators	Get a list of all Defender indicators. Optionally, specify a regex filter to limit the responses.
Defender Machine Isolation	Perform either an 'isolate' or 'unisolate' operation on a MS defender machine
Defender Machine Scan	Start a Defender ATP Machine antivirus scan
Defender Machine Vulnerabilities	Get vulnerabilities for a given Defender machine
Defender Quarantine File	Quarantine a SHA-1 file
Defender Set Indicator	Set or update an indicator with exposure values
Defender Update Alert	Update a Defender Alert
Defender Update Incident	Update a Defender Incident

Perform operations against Defender such as synchronize incidents and alerts, set indicators, isolate and quarantine machines, and block file execution.

Key Features

- List, set, update and delete Defender indicators
- Search for Defender machines by IP address
- Search for Defender machines by file hash
- Isolate/unisolate Defender machines
- Restrict/unrestrict apps on a Defender machine
- Run an antivirus scan on a Defender machine
- Quarantine files on a Defender machine
- Get file information

Requirements

This app supports the IBM Resilient SOAR Platform and the IBM Cloud Pak for Security.

Resilient platform

The Resilient platform supports two app deployment mechanisms, App Host and integration server.

If deploying to a Resilient platform with an App Host, the requirements are:

- Resilient platform >= 39.0.6328.
- The app is in a container-based format (available from the AppExchange as a zip file).

If deploying to a Resilient platform with an integration server, the requirements are:

- Resilient platform >= 39.0.6328.
- The app is in the older integration format (available from the AppExchange as a zip file which contains a tar.gz file).
- Integration server is running resilient\_circuits>=30.0.0.
- If using an API key account, make sure the account provides the following minimum permissions:

Name	Permissions
Org Data	Read
Function	Read

Name	Permissions
Incident	Read, Create
Edit Incident	Fields, Owner, Status, Notes

The following Resilient platform guides provide additional information:

- *App Host Deployment Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings.
- *Integration Server Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings.
- *System Administrator Guide*: provides the procedure to install, configure and deploy apps.

The above guides are available on the IBM Knowledge Center at [ibm.biz/soar-docs](https://ibm.biz/soar-docs). On this web page, select your Resilient platform version. On the follow-on page, you can find the *App Host Deployment Guide* or *Integration Server Guide* by expanding **Resilient Apps** in the Table of Contents pane. The System Administrator Guide is available by expanding **System Administrator**.

## Cloud Pak for Security

If you are deploying to IBM Cloud Pak for Security, the requirements are:

- IBM Cloud Pak for Security >= 1.4.
- Cloud Pak is configured with an App Host.
- The app is in a container-based format (available from the AppExchange as a [zip](#) file).

The following Cloud Pak guides provide additional information:

- *App Host Deployment Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings. From the Table of Contents, select Case Management and Orchestration & Automation > **Orchestration and Automation Apps**.
- *System Administrator Guide*: provides information to install, configure, and deploy apps. From the IBM Cloud Pak for Security Knowledge Center table of contents, select Case Management and Orchestration & Automation > **System administrator**.

These guides are available on the IBM Knowledge Center at [ibm.biz/cp4s-docs](https://ibm.biz/cp4s-docs). From this web page, select your IBM Cloud Pak for Security version. From the version-specific Knowledge Center page, select Case Management and Orchestration & Automation.

## Proxy Server

The app supports a proxy server via the `https_proxy` and `http_proxy` app.config settings.

## Python Environment

Python 3.6+ is supported. Additional package dependencies may exist for each of these packages:

- msal
- rapidjson
- resilient\_circuits>=37.0.0
- resilient\_lib>=37.0.0
- simplejson

## Installation

### Install

- To install or uninstall an App or Integration on the *Resilient platform*, see the documentation at [ibm.biz/soar-docs](https://ibm.biz/soar-docs).
- To install or uninstall an App on *IBM Cloud Pak for Security*, see the documentation at [ibm.biz/cp4s-docs](https://ibm.biz/cp4s-docs) and follow the instructions above to navigate to Orchestration and Automation.

### App Configuration

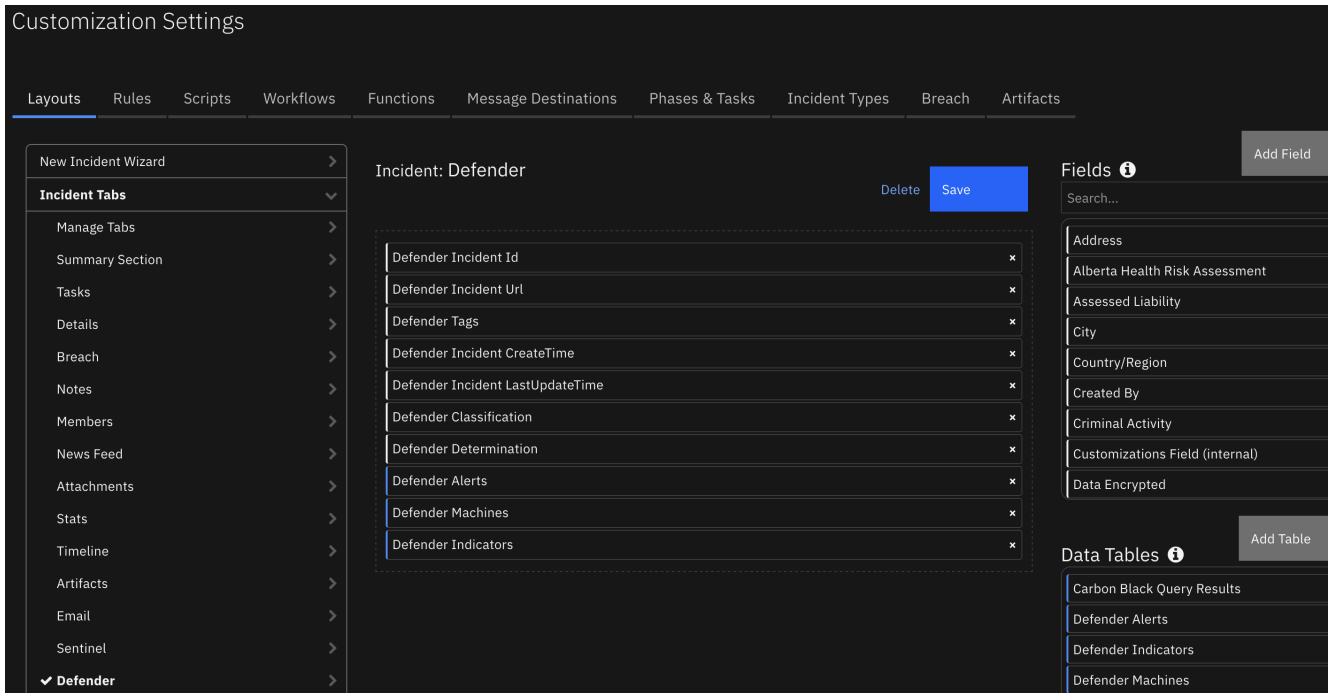

The following table provides the settings you need to configure the app. These settings are made in the app.config file. See the documentation discussed in the Requirements section for the procedure.

Config	Required	Example	Description
<code>tenant_id</code>	Yes	<code>89d65-...-57bae1c2</code>	Azure tenant Id.
<code>client_id</code>	Yes	<code>244ad4-...-3564fc4</code>	Azure app id (client id).
<code>app_secret</code>	Yes	<code>940c4d2-...-9d32e1b</code>	Azure app secret.

Config	Required	Example	Description
<b>api_url</b>	Yes	<a href="https://api.securitycenter.microsoft.com">https://api.securitycenter.microsoft.com</a>	API url. This can be customized per Azure region.
<b>polling_lookback</b>	Yes	120	When resilient-circuits starts, number of minutes to look back for changes to Sentinel incidents.
<b>polling_interval</b>	Yes	60	Number of seconds for the poller to run. Set to 0 to disable the poller
<b>new_incident_filters</b>	No	"status": ["New", "Active"],"severity": ["High", "Medium", "Low"]	filters to apply for promoting Defender incidents to SOAR. All criteria need to match. For lists [], one value needs to match.
<b>alert_filters</b>	No	"serviceSource": ["MicrosoftDefenderForEndpoint"],"severity": ["High", "Medium", "Low"]	Introduced in v1.1. Filters to apply for promoting Defender incidents to SOAR, based on the alerts associated within a Defender incident. The SOAR incident is created if all criteria is matched for at least one alert. For lists [], one value needs to match.
<b>create_incident_template</b>	No	/path/to/incident_creation_template.jinja	custom template for incident creation
<b>update_incident_template</b>	No	/path/to/incident_update_template.jinja	custom template for incident updates
<b>close_incident_template</b>	No	/path/to/incident_close_template.jinja	custom template for closing a incident
<b>update_defender_alert_template</b>	No	/path/to/defender_update_alert_template.jinja	custom template for updating an alert
<b>verify</b>	No	false	'false' to disable certificate verification or /path/to/client_certificate.pem
<b>update_defender_incident_template</b>	No	/path/to/defender_update_incident_template.jinja	custom template for updating an alert
<b>http_proxy https_proxy</b>	No	https://proxy.com	url for proxy settings

### Custom Layouts

- Import the Data Tables and Custom Fields like the screenshot below:

## Azure App Configuration

In order to use this app, an Azure app needs to be registered with the proper permissions for Defender and a client secret generated. Settings, in general are:

Application Type: Daemon with api calls enabled

API Permissions (Application type):

```
Alert.ReadAll
Alert.ReadWriteAll
File.Read.All
Incident.ReadWrite
Incident.ReadWrite.All
Ip.Read.All
Machine.CollectForensics
Machine.Isolate
Machine.Read.All
Machine.ReadWrite.All
Machine.RestrictExecution
Machine.Scan
Machine.StopAndQuarantine
Software.Read.All
Ti.Read.All
Ti.ReadWrite
Ti.ReadWrite.All
User.Read
User.Read.All
Url.Read.All
Vulnerabilities.ReadAll
```

Starting June 30th, 2020 we will no longer add any new features to Azure Active Directory Authentication Library (ADAL) and Azure AD Graph. We will continue to provide technical support and security updates but we will no longer provide feature updates. Applications will need to be upgraded to Microsoft Authentication Library (MSAL) and Microsoft Graph. [Learn more](#)

Ti.ReadWrite	Application	Read and write IOCs belonging to the app	Yes
Ti.ReadWrite.All	Application	Read and write all IOCs	Yes
Url.Read.All	Application	Read URL profiles	Yes
Vulnerability.Read.All	Application	Read Threat and Vulnerability Management vulnerability i...	Yes

**defender | Certificates & secrets**

Search (Cmd+/) << Got feedback?

**Overview**  
Credentials enable confidential applications to identify themselves to the authentication service when receiving tokens at a web addressable location (using an HTTPS scheme). For a higher level of assurance, we recommend using a certificate (instead of a client secret) as a credential.

**Certificates**  
Certificates can be used as secrets to prove the application's identity when requesting a token. Also can be referred to as public keys.

Upload certificate

Thumbprint	Start date	Expires	ID
No certificates have been added for this application.			

**Client secrets**  
A secret string that the application uses to prove its identity when requesting a token. Also can be referred to as application password.

+ New client secret

Description	Expires	Value	ID
Password uploaded on Tue Dec 29 2020	12/31/2299	74_*****	[Redacted]

## Template files

Templates are used during the synchronization of incidents and comments between Defender and IBM SOAR. These templates provide the mapping between Defender incident and SOAR incident fields. The templates cover these scenarios:

- create a SOAR incident from a Defender incident
- update an existing SOAR incident
- close a SOAR incident when the corresponding Defender incident closes
- create a Defender incident comment
- update a Defender incident alert

There are cases where these template need to be modified for your environment. For instance, customers can customize their close incident process with different required fields. In this example, the `incident_close_template.jinja` file needs to be updated and referenced in your `app.config` file as:

`close_incident_template=/path/to/your/custom/close_incident_template.jinja`

See the [Template Appendix](#) for copies of the existing templates which you can use to modify for your environment requirements.

## Function - Defender Update Incident

Update a Defender Incident
