## Release Notes

Version	Date	Notes
2.0.0	2022	REST API
1.0.0	2019	Initial Release (SOAP-based)

## Overview

### IBM QRadar SOAR app for Symantec DLP

Functions

New Function

sym

Name

Description

Symantec DLP: Get Incident Details

Get the information on the Symantec DLP incident by calling the DLP REST API incident endpoints and return the information in JSON format.

Symantec DLP: Send Note to DLP Incident

Send a note from SOAR to the corresponding Symantec DLP incident.

Symantec DLP: Update Incident Status in DLP

Update the incident status of the Symantec DLP incident in DLP.

Symantec DLP: Upload Binaries

Upload the Symantec DLP Component binary files and add as artifact files.

© Copyright IBM Corporation 2022

This app allows bi-directional synchronization between IBM Security QRadar SOAR and Symantec DLP. Symantec DLP incidents are escalated to IBM SOAR as cases with the creation of artifacts and notes in SOAR from the incident.

## Key Features

The Symantec DLP app implements the following functionality in the IBM QRadar SOAR platform:

- Poll Symantec DLP for incidents using a DLP saved report search filter and create a corresponding incident/case in the IBM SOAR platform.
- Add Symantec DLP notes to corresponding IBM SOAR incident/case.
- Create artifacts from the Symantec DLP incident in the IBM SOAR incident/case.
- Resolve a Symantec DLP incident when the corresponding IBM SOAR incident/case is closed.
- Close an IBM SOAR incident/case when the corresponding Symantec DLP incident is resolved in Symantec DLP.
- Get the Symantec DLP incident details and write the JSON in a formatted SOAR incident note.
- Create a live link in the Symantec DLP incident to the corresponding SOAR case.
- Create a live link in the a SOAR case to the corresponding Symantec DLP incident.

---

## Requirements

This app supports the IBM Security QRadar SOAR Platform and the IBM Security QRadar SOAR for IBM Cloud Pak for Security.

### SOAR platform

The SOAR platform supports two app deployment mechanisms, App Host and integration server.

If deploying to a SOAR platform with an App Host, the requirements are:

- SOAR platform  $\geq$  42.0.0.
- The app is in a container-based format (available from the AppExchange as a [zip](#) file).

If deploying to a SOAR platform with an integration server, the requirements are:

- SOAR platform  $\geq$  42.0.0.
- The app is in the older integration format (available from the AppExchange as a [zip](#) file which contains a [tar.gz](#) file).
- Integration server is running [resilient\\_circuits](#)  $\geq$  43.0.0.
- If using an API key account, make sure the account provides the following minimum permissions:

Name	Permissions
Org Data	Read
Function	Read
Incident	Read, Edit, Create, Owner, Status
Incident Notes	Edit

The following SOAR platform guides provide additional information:

- *App Host Deployment Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings.
- *Integration Server Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings.
- *System Administrator Guide*: provides the procedure to install, configure and deploy apps.

The above guides are available on the IBM Documentation website at [ibm.biz/soar-docs](https://ibm.biz/soar-docs). On this web page, select your SOAR platform version. On the follow-on page, you can find the *App Host Deployment Guide* or *Integration Server Guide* by expanding **Apps** in the Table of Contents pane. The System Administrator Guide is available by expanding **System Administrator**.

## Cloud Pak for Security

If you are deploying to IBM Cloud Pak for Security, the requirements are:

- IBM Cloud Pak for Security >= 1.4.
- Cloud Pak is configured with an App Host.
- The app is in a container-based format (available from the AppExchange as a [zip](#) file).

The following Cloud Pak guides provide additional information:

- *App Host Deployment Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings. From the Table of Contents, select Case Management and Orchestration & Automation > **Orchestration and Automation Apps**.
- *System Administrator Guide*: provides information to install, configure, and deploy apps. From the IBM Cloud Pak for Security IBM Documentation table of contents, select Case Management and Orchestration & Automation > **System administrator**.

These guides are available on the IBM Documentation website at [ibm.biz/cp4s-docs](https://ibm.biz/cp4s-docs). From this web page, select your IBM Cloud Pak for Security version. From the version-specific IBM Documentation page, select Case Management and Orchestration & Automation.

## Proxy Server

The app **does** support a proxy server.

## Python Environment

Both Python 2.7 and Python 3.6 are supported. Additional package dependencies may exist for each of these packages:

- jinja2
- resilient\_circuits>=43.0.0

## Endpoint Developed With

This app has been implemented using:

Product Name	Product Version	API URL	API Version
--------------	-----------------	---------	-------------

Product Name	Product Version	API URL	API Version
Symantec DLP	15.8	https://enforce-server/ProtectManager/webservices/v2	v2

Prerequisites

- Symantec DLP Enforce Server

Configuration

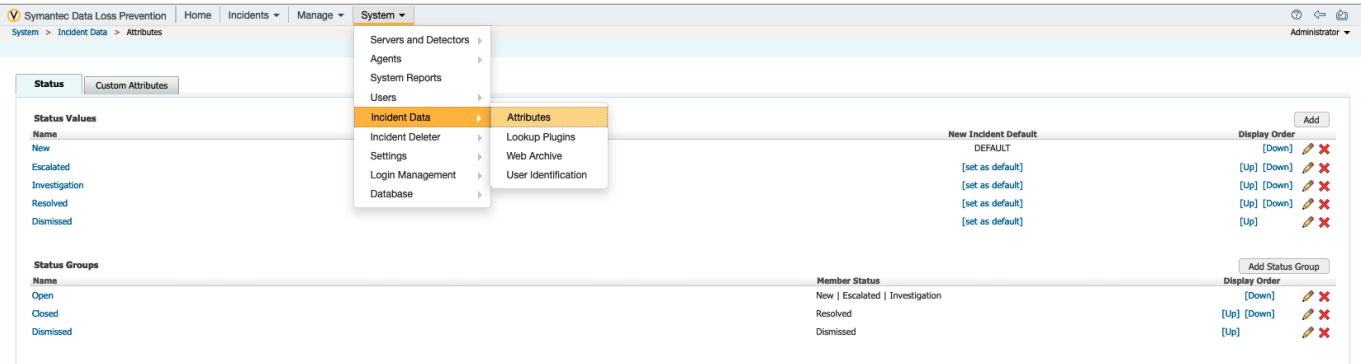

Configure Symantec DLP Custom Attributes

Two DLP Custom Attributes are used by the DLP integration to hold relevant information from the IBM SOAR platform.

`ibm_soar_case_id` custom attribute is used for filtering out already imported to SOAR incidents and avoiding duplication. Without this custom attribute in place, there is a potential for incident duplication.

`ibm_soar_case_url` custom attribute is used to provide a live link from Symantec DLP to IBM SOAR.

To create the custom attribute in Symantec DLP navigate to `System->Incident Attributes->Custom Attributes`

Select the option to Add a new Custom Attribute and create an `ibm_soar_case_id` and an `ibm_soar_case_url` custom attribute.

Default Attribute Group

Permissions

- Valid DLP user account created using the DLP Enforce Server administration console in order to access the REST API service.

Installation

Install

- To install or uninstall an App or Integration on the *SOAR platform*, see the documentation at [ibm.biz/soar-docs](#).
- To install or uninstall an App on *IBM Cloud Pak for Security*, see the documentation at [ibm.biz/cp4s-docs](#) and follow the instructions above to navigate to Orchestration and Automation.

App Configuration

The following table provides the settings you need to configure the app. These settings are made in the app.config file. See the documentation discussed in the Requirements section for the procedure.

Config	Required	Example	Description
api_version	Yes	v2	Symantec DLP REST API version.
cafile	No	``	false or /path/to/certificate.

Config	Required	Example	Description
<b>polling_interval</b>	Yes	60	Poller interval time in seconds. Value of zero to turn poller off.
<b>polling_lookback</b>	Yes	12000	Number of days to look back for DLP incidents. Value is only used on the first time polling when the app starts.
<b>sdlp_host</b>	Yes	<serverip>	Symantec DLP Enforce Server.
<b>sdlp_username</b>	Yes	<SDLP Username>	Symantec DLP account username.
<b>sdlp_password</b>	Yes	<SDLP Password>	Symantec DLP account password.
<b>sdlp_saved_report_id</b>	Yes	0	Saved Report ID used to query for incidents.
<b>create_case_template</b>	No	/path/create_case_template.jinja	Use when overriding the default template.
<b>close_case_template</b>	No	/path/close_case_template.jinja	Use when overriding the default template.
<b>update_case_template</b>	No	/path/update_case_template.jinja	Use when overriding the default template.

## Function - Symantec DLP: Get Incident Details

Get the information on the Symantec DLP incident by calling the DLP REST API incident endpoints for editable, static and notes and return the information in JSON format.

The screenshot shows the 'Customization Settings' page for the 'symantec\_dlp\_get\_incident\_details' function in IBM Security SOAR. The interface includes a top navigation bar with 'IBM Security SOAR', 'Dashboards', 'Inbox', 'Incidents', and 'Create incident'. The main content area has tabs for 'Layouts', 'Rules', 'Scripts', 'Workflows', 'Functions', 'Message Destinations', 'Phases & Tasks', 'Incident Types', 'Breach', and 'Artifact Types'. The 'Functions' tab is active, showing the configuration for 'symantec\_dlp\_get\_incident\_details'. The configuration fields are: Name (Symantec DLP: Get Incident Details), API Name (symantec\_dlp\_get\_incident\_details), Message Destination (Symantec DLP Message Destination), and Description (Get the information on the Symantec DLP incident by calling the DLP REST API incident endpoints and return the information in JSON format.). The 'Inputs' section shows 'sdlp\_incident\_id'. The 'Input Fields' section is empty. The right sidebar shows metadata: Creator (Admin User), Last Modified (02/22/2022 14:33), Last Modified By (Admin User), and Associated Workflows (Symantec DLP: Write Incident Details to Note). Buttons for 'Cancel', 'Save & Close', and 'Save' are at the top right.

## ► Inputs:

Name	Type	Required	Example	Tooltip
<code>sdlp_incident_id</code>	<code>number</code>	Yes	-	-

## ► Outputs:

**NOTE:** This example might be in JSON format, but `results` is a Python Dictionary on the SOAR platform.

```

```

## Function - Symantec DLP: Send Note to DLP Incident

Send an case note from SOAR to the corresponding Symantec DLP incident.

The screenshot shows the 'Customization Settings' page for the function 'symantec\_dlp\_send\_note\_to\_dlp\_incident'. The page includes tabs for Layouts, Rules, Scripts, Workflows, Functions (selected), Message Destinations, Phases & Tasks, Incident Types, Breach, and Artifact Types. The function details are as follows:

- Name:** Symantec DLP: Send Note to DLP Incident
- API Name:** symantec\_dlp\_send\_note\_to\_dlp\_incident
- Message Destination:** Symantec DLP Message Destination
- Description:** Send a note from SOAR to the corresponding Symantec DLP incident.
- Inputs:**
  - sdlp\_incident\_id
  - sdlp\_note\_text
- Input Fields:**
  - sdlp
  - sdlp\_incident\_id
  - sdlp\_incident\_status
- Metadata:**
  - Creator: Admin User
  - Last Modified: 02/22/2022 14:33
  - Last Modified By: Admin User
  - Associated Workflows: Symantec DLP: Send SOAR Note to DLP

### ► Inputs:

Name	Type	Required	Example	Tooltip
sdlp_incident_id	number	Yes	—	—
sdlp_note_text	text	Yes	—	—

### ► Outputs:

**NOTE:** This example might be in JSON format, but `results` is a Python Dictionary on the SOAR platform.

```

results = {
  "version": 2.0,
  "success": true,
  "reason": null,
  "content": {
    "success": true,
    "reason": null
  },

incident.addNote(noteText)
```

## Function - Symantec DLP: Upload Binaries

Upload the Symantec DLP Component binary files contained in a DLP incident and add as artifact files. An automatic rule **Symantec DLP: Upload Binaries** is included in this package but disabled by default. The automatic rule is triggered when an case is created and uploads the binary files at that time. However due to bandwidth considerations when uploading many files when the poller it escalating many incidents enabling this rule may not be advisable. A manual menu item rule **Symantec DLP: Upload Binaries as Artifact** the is run off a SOAR case is also included to allow the user to chose which binary files to upload to an incident.

The screenshot shows the 'Customization Settings' page for the 'symantec\_dlp\_upload\_binaries' function in IBM Security SOAR. The page has a dark theme and a top navigation bar with links for Dashboards, Inbox, Incidents, and a 'Create incident' button. The main content area is divided into tabs: Layouts, Rules, Scripts, Workflows, Functions (selected), Message Destinations, Phases & Tasks, Incident Types, Breach, and Artifact Types. The 'Functions' tab is active, showing the configuration for 'symantec\_dlp\_upload\_binaries'. The configuration includes fields for Name, API Name, Message Destination, and Description. The 'Inputs' section lists 'sdlp\_incident\_id' and 'incident\_id'. The 'Input Fields' section shows a search bar and a list of fields: 'sdlp\_incident\_id' and 'sdlp\_incident\_status'. The right sidebar displays metadata: Creator (Admin User), Last Modified (02/22/2022 14:33), Last Modified By (Admin User), and Associated Workflows (Symantec DLP: Upload Binaries). Buttons for 'Cancel', 'Save & Close', and 'Save' are at the top right.

else:
    note = u"{0}artifact NOT added".format(note)
incident.addNote(helper.createRichText(note))
```

---

## Script - Convert JSON to rich text v1.1

This script converts a json object into a hierarchical display of rich text and adds the rich text to an incident's rich text (custom) field or an incident note. A workflow property is used to share the json to convert and identify parameters used on how to perform the conversion.

Typically, a function will create the workflow property 'convert\_json\_to\_rich\_text', and this script will run after that function to perform the conversion.

Features:

- Display the hierarchical nature of json, presenting the json keys (sorted if specified) as bold labels
- Provide links to found URLs
- Create either an incident note or add results to an incident (custom) rich text field.

**Object:** incident

► Script Text:

```
# (c) Copyright IBM Corp. 2010, 2020. All Rights Reserved.
VERSION = 1.1
"""
    This script converts a json object into a hierarchical display of rich
    text and adds the rich text to an incident's rich text (custom) field or
    an incident note.
    A workflow property is used to define the json to convert and identify
    parameters used on how to perform the conversion.
    Typically, a function will create workflow property and this script will
    run after that function to perform the conversion.
    Features:
        * Display the hierarchical nature of json, presenting the json keys as
        bold labels
        * Provide links to found URLs
        * Create either an incident note or add results to an incident
        (custom) rich text field.

    In order to use this script, define a workflow property called:
    convert_json_to_rich_text, to define the json and parameters to use for
    the conversion.
```

```
Workflow properties can be added using a command similar to this:
workflow.addProperty('convert_json_to_rich_text', {
    "version": 1.1,
    "header": "Artifact scan results for: {}".format(artifact.value),
    "padding": 10,
    "separator": u"<br />",
    "sort": True,
    "json": results.content,
    "json_omit_list": ["omit"],
    "incident_field": None
})
```

Format of workflow.property.convert\_json\_to\_rich\_text:

```
{
    "version": 1.1, [this is for future compatibility]
    "header": str, [header line to add to converted json produced or None.
Ex: Results from scanning artifact: xxx. The header may contain rich text
tags]
    "padding": 10, [padding for nested json elements, or defaults to 10]
    "separator": u"<br />"|list such as ['<span>','</span>'], [html
separator between json keys and lists or defaults to html break: '<br />'.
If a list, then the data
is brackets by the pair specified]
    "sort": True|False, [sort the json keys at each level when displayed]
    "json": json, [required json to convert]
    "json_omit_list": [list of json keys to exclude or None]
    "incident_field": "<incident_field>" [indicates a builtin rich text
incident field, such as 'description'
or a custom rich text field in
the format: 'properties.<field>'. default: create an incident note]
}
```

```
import re

# needed for python 3
try:
    unicode("abc")

## Troubleshooting & Support

Refer to the documentation listed in the Requirements section for troubleshooting information.

### For Support

This is an IBM supported app. Please search [ibm.com/mysupport](https://ibm.com/mysupport) for assistance.

## Template Appendix

Below are examples of templates for creating, updating, and closing IBM SOAR incidents. Customize these templates and refer to them in the app.config file. These default jinja templates map IBM SOAR fields to SentinelOne threat and agent fields.

Each template should be reviewed for correctness in your enterprise. For instance, closing a SOAR incident may include additional custom fields which the default template does not include.
