Release Notes

| Version | Date | Notes |
|---------|---------|--|
| 1.0.0 | 12/2020 | Initial Release |
| 1.1.0 | 07/2021 | Support for Flows and QRoc |
| 1.1.1 | 07/2021 | Fixed selftest failing when using cafile |
| 1.1.2 | 10/2021 | Update to use latest resilient-circuits |
| 1.1.3 | 01/2022 | Support for latest Analyst Workflow versions |

| Version | Date | Notes |
|---------|---------|---|
| 1.2.0 | 01/2022 | Allow multiple QRadar instances |
| 1.2.1 | 03/2022 | Bug fix |
| 2.0.0 | 02/2022 | Real time update to the Offense Summary |

For customers upgrading from a previous release, the app.config file must be manually edited to add labels to each server configuration

Overview

QRadar Enhanced Offense Data Migration

This app fetches the data associated with the QRadar Offense and provides live links back to QRadar, thereby simplifying case management.

Key Features

- Offense data available in a SOAR "QR Offense Details" tab as part of the Case to simplify reviewing information in one central/consistent location.
- Access to detailed Offense information by following the hotlink from the SOAR UI to QRadar Analyst Workflow.
- Centralize QRadar Offense IoC's associated with Security Events under Artifacts in order to use SOAR enabled integrations to enrich and remediate cases and provide visibility to the response team.

Requirements

This app supports the IBM SOAR Platform and the IBM Cloud Pak for Security.

SOAR platform

The SOAR platform supports two app deployment mechanisms, App Host and integration server.

If deploying to a SOAR platform with an App Host, the requirements are:

- SOAR platform \geq 40.0.6554.
- The app is in a container-based format (available from the AppExchange as a zip file).

If deploying to a SOAR platform with an integration server, the requirements are:

- SOAR platform \geq 40.0.6554.
- The app is in the older integration format (available from the AppExchange as a zip file which contains a tar.gz file).
- Integration server is running resilient_circuits \geq 41.1.0.
- If using an API key account, make sure the account provides the following minimum permissions:

| Name | Permissions |
|----------|-------------|
| Org Data | Read |
| Function | Read |
| Layouts | Read , Edit |

The following SOAR platform guides provide additional information:

- *App Host Deployment Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings.
- *Integration Server Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings.
- *System Administrator Guide*: provides the procedure to install, configure and deploy apps.

The above guides are available on the IBM Knowledge Center at ibm.biz/soar-docs. On this web page, select your SOAR platform version. On the follow-on page, you can find the *App Host Deployment Guide* or *Integration Server Guide* by expanding **SOAR Apps** in the Table of Contents pane. The System Administrator Guide is available by expanding **System Administrator**.

Cloud Pak for Security

If you are deploying to IBM Cloud Pak for Security, the requirements are:

- IBM Cloud Pak for Security \geq 1.4.
- Cloud Pak is configured with an App Host.
- The app is in a container-based format (available from the AppExchange as a zip file).

The following Cloud Pak guides provide additional information:

- *App Host Deployment Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings. From the Table of Contents, select Case Management and Orchestration & Automation > **Orchestration and Automation Apps**.
- *System Administrator Guide*: provides information to install, configure, and deploy apps. From the IBM Cloud Pak for Security Knowledge Center table of contents, select Case Management and Orchestration & Automation > **System administrator**.

These guides are available on the IBM Knowledge Center at ibm.biz/cp4s-docs. From this web page, select your IBM Cloud Pak for Security version. From the version-specific Knowledge Center page, select Case Management and Orchestration & Automation.

Proxy Server

The app **does** support a proxy server.

QRadar Requirements

The app works with QRadar 7.4.0 or higher and requires the QRadar Analyst Workflow app 1.2 or higher to be installed on QRadar. The QRadar Analyst workflow app can be downloaded from the IBM App Exchange - <https://exchange.xforce.ibmcloud.com/hub/extension/123f9ec5a53214cc6e35b1e4700b0806>

Installation

Install

- To install or uninstall an App or Integration on the *SOAR platform*, see the documentation at ibm.biz/soar-docs.
- To install or uninstall an App on *IBM Cloud Pak for Security*, see the documentation at ibm.biz/cp4s-docs and follow the instructions above to navigate to Orchestration and Automation .

App Configuration

The following table provides the settings you need to configure the app. These settings are made in the app.config file. See the documentation discussed in the Requirements section for the procedure.

| Config | Required | Example | Description |
|-----------------------|----------|---|--|
| host | Yes | <code>localhost</code> | QRadar host |
| username | Yes | <code>admin</code> | QRadar account username. |
| qradarpassword | Yes | <code>password</code> | Password associated with the QRadar account username |
| qradartoken | Yes | <code>cb971c75-b2f9-4445-aaae-xxxxxxxxxxxx</code> | SEC Token generated in QRadar |
| verify_cert | Yes | <code>/path/to/cert</code> | Path to certificate or specify <code>false</code> if using self signed certificate |
| search_timeout | No | <code>300</code> | Timeout for the AQL search to be specified in seconds |

MSSP Configuration

For this app, Circuits needs to be run on the config org so that the tab is created in the config org via an API call and then afterwards, the config push is run to push to the child orgs .

Custom Layouts

Upon installation, this app adds a tab comprising of the custom fields and data tables to the Case management, if the Case has an associated Offense ID. Each of the fields and data tables have information associated with the Offense and a few have live links to QRadar Analyst Workflow. The data here is populated during the initial escalation of an Offense to a case.

All screenshots are examples of using the app with Cloud Pak.

Function - QRadar Offense Summary

Fetch QRadar Offense Details.

► Inputs:

| Name | Type | Required | Example | Tooltip |
|-------------------|------|----------|---------|--|
| qradar_label | text | No | – | Name of QRadar server to use from the app.config |
| qradar_offense_id | text | No | – | The ID of the given offense |
| qradar_query_type | text | No | – | - |

► Outputs:

```
results = {
  {

Rules

| Rule Name | Object | Workflow Triggered |
|-------------------------------------|-----------------------|--|
| Create artifact from Source IP info | qr_top_source_ips | - |
| QRadar Enhanced Data | incident | qradar_offense_summary, qradar_triggered_rules, qradar_destination_ips, qradar_source_ips, qradar_categories, qradar_assets_information, example_of_searching_qradar_top_events_using_offense_id |
| Create Artifact from Events info | qr_offense_top_events | - |

| Rule Name | Object | Workflow Triggered |
|--|------------------------|--------------------|
| Create Artifact from Assets info | qr_assets | — |
| Create artifact from Destination IP info | qr_top_destination_ips | — |

The rule, QRadar Enhanced Data, is an automatic rule that triggers when a new incident with a `qradar_id` value and a `qradar_destination` value is created, or an existing incident whose `qradar_id` value is updated. This rule triggers workflows as listed above and populates the Offense information in the custom fields and data tables. The rules for creating artifacts are menu item rules associated with the data tables. These rules can be executed at row level to generate artifacts from the column values. The workflows' input and post processing scripts can be customized for data retrieval and data presentation.

For Customers who do not use the QRadar-Plugin

Make sure at the time of escalation the field `qradar_destination` is mapped to have the appropriate value (same as label in `app.config`). If value not present at the time of case creation - have a rule on Incident creation that runs a script to populate the `qradar_destination` value.

Troubleshooting & Support

Refer to the documentation listed in the Requirements section for troubleshooting information.

For Support

This is a IBM supported App. For assistance - <https://ibm.com/mysupport>.
